*Abstract 8002. Lung cancer diagnosis rates (LCDR) in Lung Cancer Screening (LCS) and incidental Pulmonary Nodule (IPN)*

## DELUGE questions and how to move forward

Question	DELUGE
Did we <b>reach</b> the population at risk?	How many eligible were NOT screened (LCS) or evaluated (IPN)?
Optimizing nodule <b>risk assessment?</b>	LungRADS score & IPN size work What was false+ rate and how to ↓?
(Best) FU <b>interval</b>	USPSTF21 = yearly, IPN = Fleischer What was adherence and is this an optimal interval?
Evaluate & integrate <b>interventions to ↓ risk</b>	Was smoking cessation program incorporated? Other risk factors evaluated & addressed?

# Factores de riesgo

Abstract 10573. NSCLC in BRCA germline carriers

- Patients with pathogenic germline variants (PGVs) in BRCA1 and BRCA2 may have an increased risk of developing cancer (estimate 5- 7%). Single institution

Results		
	BRCA1/2 PGV (N=25)	PGV Negative (N=623)
Median age of onset, years	68 ± 14	67 ± 13
Female Sex	16 (64%)	319 (51%)
Never Smoker	11 (44%)	99 (16%) p<0.01
Stage I or II at diagnosis	14 (56%)	370/561 (66%)
Adenocarcinoma	17 (68%)	445 (71%)
Squamous cell	5 (20%)	120 (19%)

**Recurrence:** 3/14 (21.4%) BRCA1/2 PGV patients with stage I-II NSCLC had recurrence within 5-years of definitive local therapy

**Molecular Drivers:** 6/11 (54.5%) of BRCA1/2 PGV patients with stage III-IV NSCLC had actionable alterations (3 EGFR, 1 ALK, 1 KRASG12C, 1 MET)

Among 11 BRCA1/2 PGV patients with advanced stage III-IV disease, 6 had actionable genetic alterations, most commonly in EGFR (3/11).

## Abstract 8055. LC- SHIELD study in never smokers

### STUDY DESIGN

### Sensitivity and Specificity for Detection of Lung Nodule $\geq 5\text{mm}$ (per subject basis)

- Local data was used for iterative fine-tuning, optimizing the algorithm after analysis of first 181 cases.
- Sensitivity, specificity and concordance were evaluated in the validation cohort.

	AI-positive	Sensitivity	Specificity	Concordance
Before fine-tuning (n=181)	64%	88%	52%	67%
After fine-tuning (n=181)	43%	81%	85%	83%
Validation cohort (n=224)	39%	73%	77%	76%

LUNG SIGHT AI first reader: High Lung cancer detection rate

For any primary pulmonary resection performed with curative intent

(including non-anatomic parenchymal-sparing resections)

Resect nodes from:

**Mediastinum** (Stations 2-9)  
≥3 distinct stations

**Hilum** (Stations 10-14)  
≥1 station

**Objective:** Increase compliance with Standard 5.8 ≥80% after participation in the Lung NODES national quality improvement (QI) collaborative

Compliance from 67% - 90%

**Table 3.** Adjusted multilevel analysis of factors associated with compliance

Characteristic	Compliance with Standard 5.8 OR (95% CI)	p-value
<b>Data Collection Period</b>		
Baseline (March)	Ref.	
Quarter 2 (June)	1.70 (1.49 – 1.94)	<0.001
Quarter 3 (September)	2.12 (1.85 – 2.42)	<0.001
Final (December)	2.50 (2.19 – 2.86)	<0.001
<b>Surgical Approach</b>		
Robotic assisted	1.38 (1.22 – 1.56)	<0.001

<b>Resection</b>		
Lobectomy	Ref.	<0.001
Segmentectomy	0.76 (0.65 – 0.89)	<0.001
Wedge	0.44 (0.40 – 0.48)	<0.001

**Figure 2.** Median hospital-level compliance increased from 67.8% at baseline to 90.5% post-participation

# Surgery

Abstract poster 8067. Quality metric in Surgery CoC. N: 4536 patients

- Sampling of at least 3 mediastinal and at least 1 hilar lymph node stations during lung cancer resection was adopted by the American College of Surgeons (ACS) Commission on Cancer (CoC) as Operative Standard 5.8

Median OS was superior in concordant (7.6y) v non-concordant (6.1y) patients (p=0.0004, Fig. 1).

Fig 1. Overall survival by 3+1-concordance status

## Conclusions

In this large, community, population-based surgical database,

CoC OS 5.8 “3+1” LN adherence for lung cancer resection was associated with:

- ↑ surgical complications  
but also
- ↑ nodal upstaging
- ↑ adjuvant treatment utilization
- ↑ overall survival

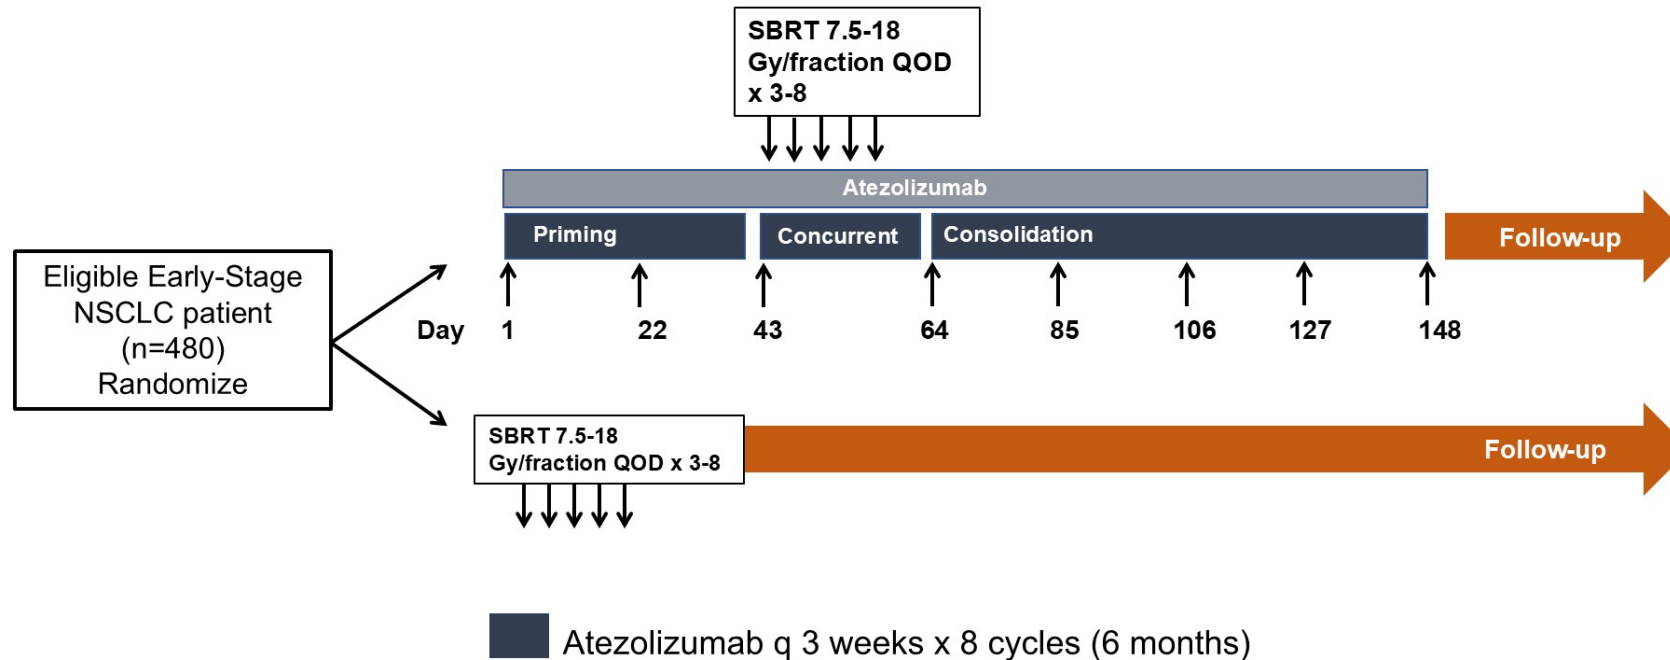

These findings:

- likely represent real-world practice and outcomes
- support the use of this quality metric for curative-intent lung cancer surgery.

## Abstract 2024. Irradiated tumor volumen as predictor of local recurrence and radionecrosis in BM treated with SRS

### Study Population and Data Collection

- Retrospective cohort study of 431 lung  patients with BM treated with single fraction Gamma-Knife, 2009- 2020, all-comers cohort from Stockholm region
- <sup>11</sup>C-methionine PET-CT: LNR >2 as threshold

### Statistical Analysis

- Cox regression models (penalized splines for non-
- Risk predictions at 6 and 12 months
- Sensitivity/specificity of PET-CT vs MRI
- Software: R version 4.2.2 with relevant packages

Andreas Karlsson, MD, PhD

## Results

### Predicted 6- and 12-month risk of LC vs total volume of BM

### Diagnostic performance of MET-PET vs MRI for RN & LR

- Sensitivity: 0.9091
- **Specificity: 0.6**
- Accuracy: 0.8519
- Positive predictive value: 0.9091
- Negative predictive value: 0.6

# Brain SRS

Abstract 2024. Irradiated tumor volumen as predictor of local recurrence and radionecrosis in BM treated with SRS

- Larger irradiated tumor volumes were correlated with ↑ RN or LR risk
- ↓ volumes can lead to RN & LR, not evident at 6m, but emerging by 12m post-SRS
- <sup>11</sup>C-methionine PET-CT: ⚡ significant advantages in distinguishing LR from RN

## CNS Metastases Volume: A Predictor for Recurrence & Radionecrosis
